Big Data vs Data Mining | Find Out The Best 8 Differences
Big data and data mining are two different things. Both of them relate to the use of large data sets to handle the collection or reporting of data that serves businesses or other recipients. However, the two terms are used for two different elements of this kind of operation. Big data is a term for a large data set.

What is the difference between big data and data mining?
Data Mining Vs Big Data Data Mining uses tools such as statistical models, machine learning, and visualization to "Mine" (extract) the useful data and patterns from the Big Data, whereas Big Data processes high-volume and high-velocity data, which is challenging to do in older databases and analysis program.

Data Mining vs Big Data - Javatpoint
Big data analytics and data mining are not the same. Both of them involve the use of large data sets, handling the collection of the data or reporting of the data which is mostly used by businesses. However, both big data analytics and data mining are both used for two different operations. Let’s look deeper at the two terms.
