1. Introduction. Wastewater treatment plants (WWTPs) are a significant point source of microplastics (MPs) in the environment in recent years (Mason et al., 2016; Murphy et al., 2016; Sun et al., 2019). However, only a small amount of MPs in wastewater is directly discharged into the aquatic environment, and more than 98% of the MPs are trapped in sewage sludge resulting in high concentrations ...

Fast pyrolysis thermochemically degrades lignocellulosic material into solid char, organic liquids, and gaseous products. Using fast pyrolysis to produce renewable liquid bio-oil to replace crude oil is gaining commercial interest. The production of pyrolysis bio-oil needs to be improved through standardization. Only with standard operational methods can pyrolysis bio-oil be commercially ...

All pre-treatments tested increased the content of cellulose in the fibres by degrading and dissolving non-cell wall material (NCWM, e.g., pectin and waxes), lignin and to some degree hemicellulose. A high loss of dry matter in the process was connected with a high loss of cellulose since cellulose is the main component.

Effects of pre-sowing seed treatments on establishment of dry direct-seeded early rice under chilling stress. Our study revealed that priming treatments significantly enhanced the seed germination and seedling growth of dry direct-seeded early rice under chilling stress. The improved emergence and vigorous seedling growth induced by the seed priming treatments were associated with increased α -amylase activity and total soluble sugar contents in the primed seedlings.
