In physics, electromagnetic radiation (EM radiation or EMR) refers to the waves (or their quanta, photons) of the electromagnetic field, propagating (radiating) through space, carrying electromagnetic radiant energy. It includes radio waves, microwaves, infrared, (visible) light, ultraviolet, X-rays, and gamma rays.

Extremely low frequency (ELF) is the ITU designation for electromagnetic radiation (radio waves) with frequencies from 3 to 30 Hz, and corresponding wavelengths of 100,000 to 10,000 kilometers, respectively. In atmospheric science, an alternative definition is usually given, from 3 Hz to 3 kHz. In the related magnetosphere science, the lower frequency electromagnetic oscillations (pulsations ...

The microwaves are a the wave type that are sandwiched between radio waves and infrared on of radiation electromagnetic spectrum. In the case of microwave ovens, commonly used frequency of wave is roughly 2,450 megahertz (2.45 gigahertz). Waves in this range of frequency have an interesting property: They're absorbed by water, fats and sugars.

The sun is a big source of natural EMFs, including visible light and UV radiation. Our own electromagnetic signals are very weak compared to the man-made EMFs. Exposure to man-made EMFs can interfere with the electromagnetic systems inside of our bodies.

An antenna subsystem of a communication device has an open cavity including an inner opening and lateral and outer sides that define a cavity. The cavity is sized less than required for cavity mode resonance at a millimeter-wave operating frequency. A millimeter-wave antenna element placed at the inner opening of the hollowed section cavity excites evanescent electromagnetic fields in the cavity.
