$ay = x$ . By taking the natural logarithm of both sides, we have.  
 $\ln ay = \ln x, \Rightarrow y \ln a = \ln x, \Rightarrow y = \frac{1}{\ln a} \ln x, \Rightarrow \log_a x = \frac{1}{\ln a} \ln x$ . The last formula expresses logarithm of a number  $x$  to base  $a$  in terms of the natural logarithm of this number. By setting  $x = e$ , we have.  
 $\log_a e = \frac{1}{\ln a} \ln e = \frac{1}{\ln a}$ . If  $a = 10$ , we obtain:

The natural logarithm of a number  $x$  is the logarithm to the base  $e$ , where  $e$  is the mathematical constant approximately equal to 2.718. It is usually written using the shorthand notation  $\ln x$ , instead of  $\log_e x$  as you might expect. You can rewrite a natural logarithm in exponential form as

mathematically,  $x$  is the logarithm of  $n$  to the base  $b$  if  $b^x = n$ , in which case one writes  $x = \log_b n$ . For example,  $2^3 = 8$ ; therefore, 3 is the logarithm of 8 to base 2, or  $3 = \log_2 8$ . In the same fashion, since  $10^2 = 100$ , then  $2 = \log_{10} 100$ .
