Authors: J. Kijanienko; P. Vielh . Description: This monograph is based on a detailed review of more than 1,600 aspiration cytology biopsies of salivary gland tumors, including even rare entities, which were collected over a period of 45 years at the Institut Curie and correlated with histopathological diagnoses according to the most recent classifications (WHO and AFIP).

**Salivary Gland Tumours: Monographs in Clinical Cytology**  
Salivary gland tumors are growths of abnormal cells (tumors) that begin in the salivary glands. Salivary gland tumors are rare. Salivary glands make saliva, which aids in digestion, keeps your mouth moist and supports healthy teeth. You have three pairs of major salivary glands under and behind your jaw — parotid, sublingual and submandibular.

**Salivary gland tumors - Symptoms and causes - Mayo Clinic**  
Abstract. The salivary gland section in the 4th edition of the World Health Organization classification of head and neck tumors features the description and inclusion of several entities, the most significant of which is represented by (mammary analogue) secretory carcinoma. This entity was extracted mainly from acinic cell carcinoma based on recapitulation of breast secretory carcinoma and a shared ETV6-NTRK3 gene fusion.

The malignant tumours most commonly affecting the major salivary glands are mucoepidermoid carcinoma, acinic cell carcinoma and adenoid cystic carcinomas. Among the minor salivary glands, adenoid cystic carcinoma is the most common. Malignant tumours are designated high-grade or low-grade dependent on their histology.

**Salivary Gland Tumours Information page. Symptoms info ...**  
Salivary gland tumours or neoplasms are tumours that form in the tissues of salivary glands. The salivary glands are classified as major or minor. The major salivary glands consist of the parotid, submandibular, and sublingual glands. The minor salivary glands consist of 800-1000 small mucus-secreting glands located throughout the lining of the oral cavity.

**Salivary gland tumour - Wikipedia**  
The parotid glands are one set of three pairs of major salivary glands. Each set of glands has its own tube (duct) leading from the gland to the mouth. Parotid tumors are abnormal growths of cells (tumors) that form in the parotid glands. The parotid glands are two salivary glands that sit just in front of the ears on each side of the face.

**Parotid tumors - Overview - Mayo Clinic**  
The two parotid glands are major salivary glands wrapped around the mandibular ramus in humans. These are largest of the salivary glands, secreting saliva to facilitate mastication and swallowing, and amylase to begin the digestion of starches. It is the serous type of gland which secretes alpha-amylase (also known as ptyalin). It enters the oral cavity via the parotid duct.

**Salivary gland - Wikipedia**  
Most salivary gland cancers start here. The major gland sets are: Parotid glands. These are the largest salivary glands. About 70% of salivary gland tumors start here. Most of the time, they're ...

**What Is Salivary Gland Cancer? What Are the Symptoms?**  
Salivary gland tumors are abnormal cells growing in the ducts that drain the salivary glands The tumors usually cause a firm, painless swelling in one of the salivary glands, and the size of the swelling gradually increases. Sometimes, these tumors also cause facial nerve palsy, which makes it difficult for patients to move one side of the face.
