Trigonometric identities are true for all replacement values for the variables for which both sides of the equation are defined. Conditional trigonometric equations are true for only some replacement values. Solutions in a specific interval, such as $0 \leq x \leq 2\pi$, are usually called primary solutions. A general solution is a formula that names all possible solutions.

Trigonometry: Trigonometric Functions: Study Guide ...
Trigonometry. Trigonometry is a branch of mathematics which deals with triangles, particularly triangles in a plane where one angle of the triangle is 90 degrees (right angled triangles). Triangles on a sphere are also studied, in spherical trigonometry. Trigonometry specifically deals with the relationships between the sides and the angles of triangles, that is, the trigonometric functions, and with calculations based on these functions.

Here θ is an obtuse angle, between 90° and 180°. The reference angle alpha α is equal to $180° − \theta$, and is the acute angle within the right-angled triangle. Sin θ = Sin α =. opposite (red line) hypotenuse (blue line) Both the blue and red lines are positive, so sin θ is positive. Cos θ = −Cos α =.

sin -1 (x) = A. cos B = y. cos -1 (y) = B. tan C = z. tan -1 (z) = C. The regular trig functions give us side lengths when we plug in an angle, so the inverse trig functions do the opposite: when we plug in a side length (like x, y, or z), we'll get an angle as our answer (A, B, or C).
